

4. The string is a sequence of characters placed in double quotes (” “). Performing different operations on string data is called String Handling. Strings are immutable. Whenever a change to a String is made, an entirely new String is created. If we want to store a group of characters we can use a char array. String provides various methods to perform different operations on strings. Using Raptor draw a flowchart to display the total number of characters in the string and returns it.

Algorithm

1. Start.
2. Declare a string variable str.
3. Input the string from the user.
4. Calculate the length of the string using Length_of(str).
5. Store the result in a variable count.
6. Display "Total number of characters = " and count.
7. Stop.
